Incident documentation/20141113-EventLogging

[< Incident documentation](#)

Contents [\[hide\]](#)

- [1 Summary](#)
- [2 Timeline](#)
- [3 Conclusions](#)
- [4 Actionables](#)

Summary

Restarting consumers after temporary switch of m2-master CNAME caused ~20 minute outage of writing events to the database between 2014-11-13T00:59 -- 2014-11-13T01:21. (The data did not get lost, as the data is available in log files.)

Timeline

2014-11-13T00:34

Change [I463760](#) got merged and updated `m2-master` to point to `dbproxy1002` to test [db proxying](#).

2014-11-13T00:59

EventLogging's `mysql-m2-master` consumer got restarted by hand to pick up the above dns change.

The consumer failed to connect to `m2-master` (which now pointed to `dbproxy1002`).

So from this time on, no EventLogging events could get written to the database.

(But the other consumers (like the plain log file writer) continued to work as expected.)

2014-11-13T01:19

The above dns change got reverted by change [I862947](#).

2014-11-13T01:21

EventLogging's `mysql-m2-master` got restarted by hand to pick up the above dns change.

The consumer could again connect to `m2-master` (which now pointed to `db1020` again).

EventLogging events started to get written again to the database.

Conclusions

- The fact that EventLogging is writing data synchronously and not buffering up database writes (hence cannot handle database connection issues nicely) is not known visible enough throughout the foundation.
- Regardless of the testing done in labs, production firewalls get in the way.

Actionables

- Status: ■ **Done** Make sure that log files exist for the affected period, so we can backfill.
Logs exist (on `vanadium`), not yet on `stat1002`, or `stat1003` and look good.
- Status: ■ **Done** Backfill the data.
- Status: ■ **Done** Make sure `vanadium` can connect to `dbproxy1002` ([RT8863](#)).
